Problem Statement

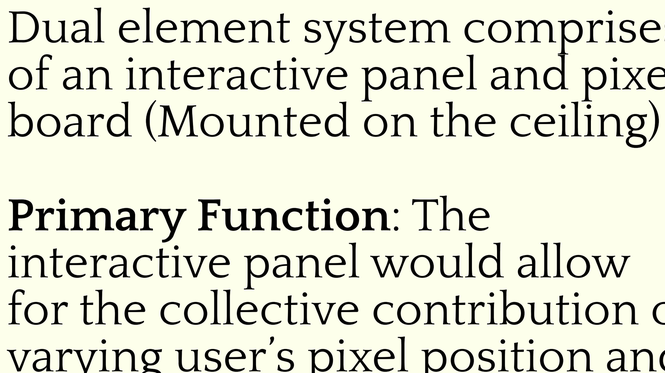

The bus stop is a communal space where varying individuals come together daily. And this could be a possible opportunity where meaningful interactions can be carried out.

However, due to the bus stop having minimal forms of interactions taking place. It contributes to the boredom and feeling of isolation about the bus stop.

Design Goal

How might we **increase community-based interactions** at the **bus stop** through the **use of interactive lighting.**

Design Solution

Dual element system comprises of an interactive panel and pixel board (Mounted on the ceiling)

Primary Function: The interactive panel would allow for the collective contribution of varying user's pixel position and colour choice, as well as serve as a point for meaningful exchanges of ideas.

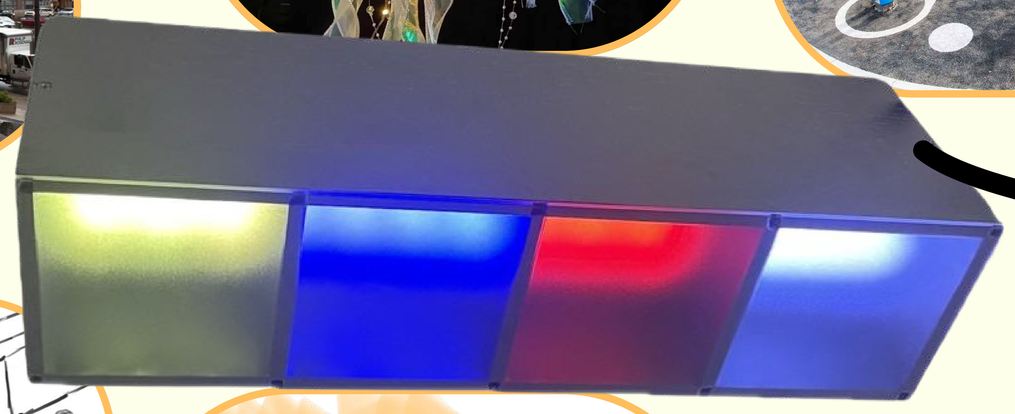

Secondary Function: A bus boarding system, which indicates the bus's entrances (Pixel Board) as well as the notification of the bus arrival (Interactive panel).

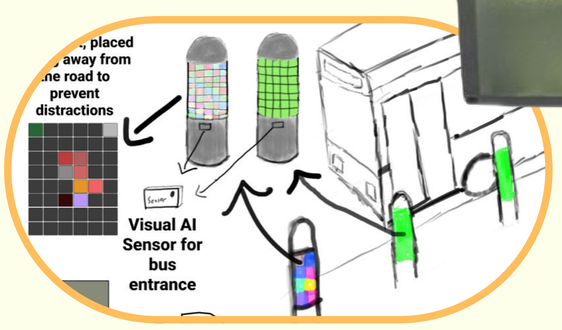

Inspirations

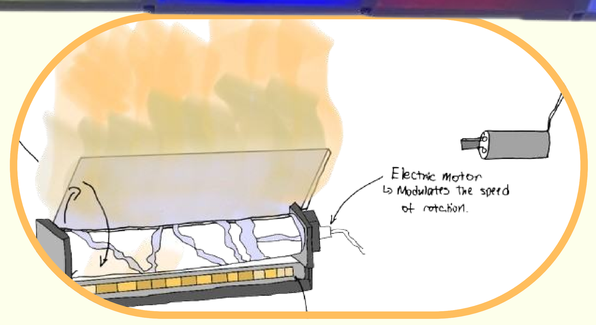

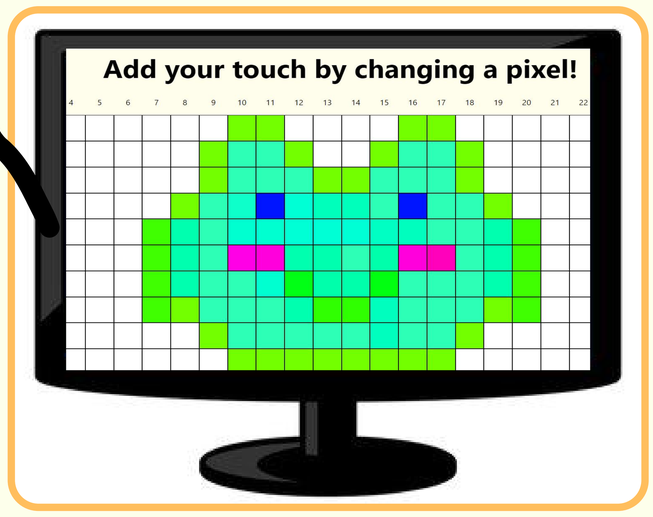

LED bollards

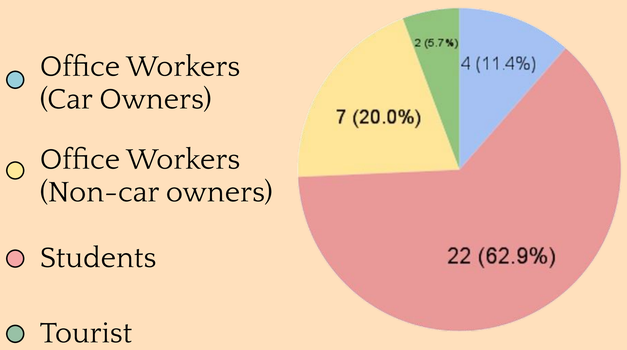

LED Wave projector

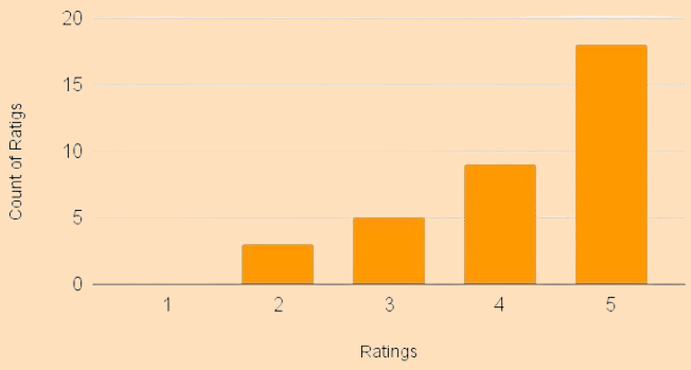

Interactive Panel

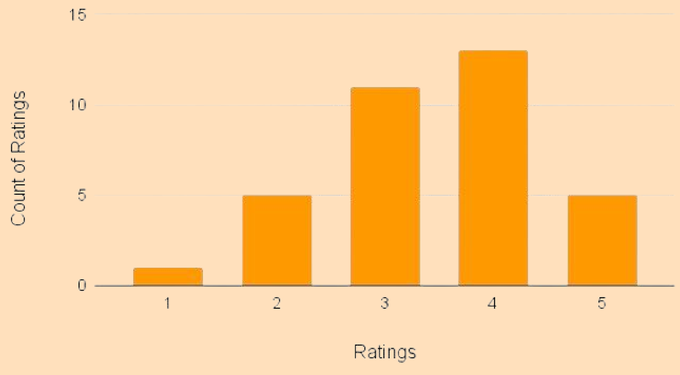

User Testing

A majority of the users are students, followed by both types of office workers and even a few tourists.

Most people found the installation to be easy to use, with some older office workers and a tourist finding some difficulty

The overall consensus was that the installation did a decent job at fostering community based interaction at the bus stop.

Improvements

- Change in depth for more dimension
- More sustainable materials
- Animation of pixel arts
- Gradient control over each pixel
- Bus interval timing display
- Multiple pixel selection
- Day montage of pixel art changing
